

- Based on our research, we will be doing a corporate environment with a “robot”
- Robot will be a lowfid, basically an app on an ipad
 - with boxes as robot body
- Then we will have an additional app on phone
- So then it is going to be robot+app solution
- So when you have a conversation and you don't know the word, you can say, “hey robot, how do i say X in English” and then it will translate it for you in the moment
- Then afterwards, it will send a notification to you in the app with the word(s) you don't know, and do targeted learning exercises based on the word. Then it can show mastery.

Things to do

- Gather materials & build 'robot' frame - Natasha & Trent
- Design frontend robot and app on figma - Isabelle lead, but all work on it
- Upload lowfid sketches - Isabelle
- Build robot frontend and backend - Ameera
- Build app frontend and backend - Nayla
- Upload everything into github - Natasha

Everything with react, sql
