

For an event, AI will shortlist a selection of clothes that fit the event. Then users can enter the app and pick a section of the outfit to style. Together, it will create one outfit, and people can vote on their best outfits

3. Prepare the Design Proposal Presentation

10 minutes + Q&A. You're still narrowing down between concepts — explain what's still in contention and how you'll narrow it.

Cover:

1. Your team and its combined strengths (not individual bios)
2. The domain/problem space, backed by your research
3. Your design opportunity and initial concepts, linked to research and any interviews/observations
4. Your intended audience — go beyond demographics: their skills, values, workflows, priorities
5. A critique of existing solutions in this space and how yours differs
6. Your plan of work — what you still need to find out and how you'll investigate it

Slides: exactly 5, ~2 minutes each

- Slide 1: Team intro & strengths
 - Ameera
 - get icons of team
 - Team members, what we study
 - Strengths
 - Your team and its combined strengths (not individual bios)
 - Slide 2: Domain
 - Nayla
 - Domain:
 - Smart Dressing with Artificial Intelligence for Events
 - The domain/problem space, backed by your research
 - Slides 3: Design opportunity, audience, concepts, prior attempts (order flexible)
 - Trent
 - Your design opportunity and initial concepts, linked to research and any interviews/observations
- Fashion OOTD App enhanced by AI
- Recommends users to the previous OOTD's and promotes fashion brands for exposure.
 - Uses AI LLM's to configure an OOTD idea for events
 - User fashion customization via "tags"/"Hashtags"
 - Searching function via a search bar where keywords will be turned into music event OOTD reference pictures
 - Australian based App and catering to OOTD recommendations for music events and recent music related fashion trends.
 - Linkage to social media posts and music related news for references

- Slides 4: Design opportunity, audience, concepts, prior attempts (order flexible)
 - Natasha

Your intended audience — go beyond demographics: their skills, values, workflows, priorities
Demographic

- Australian Fashion Consumer Demographics
 - “young adult fashion consumers because of their strong buying power (20-28-year olds spend over \$500 billion a year)”
 - <https://www.emerald.com/jfmm/article/16/3/275/223018/Young-Australians-consumers-preferences-for-fashion>
 - “Young Australians, aged 18–34, were more likely to buy second-hand, repair, resell or share clothes”
 - <https://www.rmit.edu.au/news/all-news/2024/oct/clothing-study>
- Australian Social Media User Demographics

Generation	Age bracket (in 2026)	Most popular platforms	Key social behaviours
Gen Z	16–29	TikTok, Instagram, YouTube	Social search, visual commerce and short-form video discovery
Millennials	30–45	Facebook, Instagram, LinkedIn	Multitasking, brand authenticity seeking and B2B networking
Gen X	46–61	Facebook, YouTube, LinkedIn	Private messaging, brand responsiveness and long-form education
Baby Boomers	62+	Facebook, YouTube	Legacy platform loyalty, news consumption and family connection

- - <https://sproutsocial.com/insights/social-media-demographics-australia/>
- Australian Music Event Attendees Demographics
 - “The majority of Australians say music is really important to them (62%)”
 - “Almost half of Australians attended at least one live music event in the past 12 months”
 - “18-24-year-olds are the most likely age group to attend live music events”
 - <https://creative.gov.au/news-events/news/strong-audience-demand-live-music-lives-despite-cost-living-pressure>
 - “On average, 3.4% of domestic overnight visitors went to a festival, fair or cultural event. This was higher among:
 - 20 to 24 year olds (4.2%)
 - friends or relatives travelling together without children (5.8%).
 - Capital city residents accounted for 56% of visitors to a festival, fair or cultural event.
 - Interstate travellers accounted for 39% of visitors. Traditionally, interstate travellers
 - stay longer (an average of 4.3 nights), and are more likely to attend festivals. “

- <https://www.tra.gov.au/content/dam/austrade-assets/global/wip/tra/documents/tra-domestic-visitor-profiles-festivals-and-events.pdf>

Skills

Values

- They value low cost
 - Cost is the primary barrier, and Australians are feeling less financially secure than they did before the pandemic
 - Despite cost-of-living pressures, Australians are spending more on arts and leisure
 - <https://creative.gov.au/news-events/news/strong-audience-demand-live-music-lives-despite-cost-living-pressure>
-

Workflows

A critique of existing solutions in this space and how yours differs

- Slide 5: Plan of work & methods
 - Isabelle
 - Your plan of work — what you still need to find out and how you'll investigate it
 - Are young adults having difficulties choosing what to wear for the event and will they benefit from the AI outfit recommendation?
 - Do like short questionnaire

Research Papers

An AI-Powered Wardrobe Donation and Exchange Platform Using Artificial Intelligence and Computer Vision → depop but exchanging

<https://dl.acm.org/doi/pdf/10.1145/3690001.3690021>

Chérie: A Proposed Design for a Mobile Application with AI Outfit Assistance and 3D Virtual Wardrobe → generate outfit

<https://dl.acm.org/doi/pdf/10.1145/3629378.3629415>

Idea

- Help plan out what you already have in your closet
 - User takes photo of closet
 - User have a digital closet
 - Ai will help in matching or generating the outfits based on image analysis
 - Chérie: A Proposed Design for a Mobile Application with AI Outfit Assistance and 3D Virtual Wardrobe → generate outfit
 - <https://dl.acm.org/doi/pdf/10.1145/3629378.3629415>
 - User takes the generated outfit and put it on
 - Helps users who:
 - Are running late
 - ADHD
 - Colour blind

- Working 9-5 everyday

Further ideas made by AI

1. Group coordination for a shared event

Think festivals, weddings, sports games, group nights out — situations where multiple people are dressing *for the same occasion* and want to look good *together* without looking identical. AI shortlists options per person based on event + context (venue, weather, dress code), but friends can see each other's shortlists in a shared space, react, and negotiate a group aesthetic ("let's stay in warm tones," "nobody else wear the jersey colours"). Each person still owns their full outfit — the social layer is the *awareness and negotiation* between people, not fragmentation of the garment itself. This hits coordination, awareness, articulation work (they have to actually discuss and justify choices), and can be sync (getting ready together) or async (planning days ahead).

2. AI-brokered wardrobe swapping/borrowing

The AI identifies a gap in your wardrobe for an event ("you don't own anything in the dress code's colour palette") and instead of just suggesting a purchase, it matches you with people nearby — friends or a wider community — who own that item and are willing to lend it. This adds real interaction (negotiating a swap), presence/location-awareness (who's nearby with the item), activity traces (lending history, trust/reputation), and conversation. It's socially rich because it depends entirely on other people, and mobile because it's tied to proximity and a specific event window.

3. Mentor-mentee co-styling

Pair someone unsure how to dress for a context (first job interview, first time at a formal event, moving to a new city with different norms) with a more style-confident friend or peer. AI generates a shortlist as a conversation starter, but the outfit gets built through back-and-forth dialogue between the two people — the mentor explains *why* something works, the mentee reacts and adjusts. This leans hard into mutual learning and articulation work, and is naturally collaborative because the whole point is two people reasoning together, not just voting on a finished look.

4. Shared "getting ready" sessions

Reframe the styling step as synchronous and co-present rather than solo. Instead of "AI shortlists → one person picks → people vote after," a small group opens the app together while getting ready (same room or different locations), sees AI suggestions pushed live, and talks through them in real time — closer to a group video call with a shared moodboard. Voting still happens, but the *process* of building the outfit is social, not just the outcome.

5. Making plans with your friends app

- Shows calendar with everyone's availability dates
- Events or activities to do, an add to calendar feature is added
- Dress code
- And bill splitting feature
- This app will need a voting system to make decisions, taking the brain load off the group. AI can help to automate the options based on the voted events to decide on dress code.

(hint social does not mean a group chat, it means collaboration and joint experiences. Mobile does not mean phone, it means tech that is location specific and interacts with its location (ie a smart fridge that engages with the kitchen in meaningful ways)).

Ideas

1. Real-time workplace phrase coaching

The app listens for context (calendar shows you're heading into a meeting, or you're at the office vs. remote) and prepares role-relevant vocabulary/phrases just before you need them — e.g. a construction site worker gets safety-briefing phrases, an office worker gets meeting phrases for the specific meeting on their calendar. Socially, colleagues can flag phrases that trip *them* up and share corrections/tips with each other (peer-sourced glossary), building mutual learning and activity traces (a living, crowd-corrected phrasebook for that specific workplace).

2. Buddy system for on-the-job practice

Pairs a learner with a fluent colleague (or another learner at a different level) for short, scheduled real-world practice moments — "next time you're both in the break room, try ordering your explanation of X in English." The app nudges both people when they're co-located (location-aware), tracks what was practiced, and lets the mentor leave quick feedback afterward. This is strong on presence, conversation, articulation work (the mentor has to explain corrections), and mutual learning.

3. Shared "workplace situation" simulations

Small groups (e.g. new hires from the same cohort) get pushed a realistic work scenario relevant to their context — handling a customer complaint, giving a status update — and work through it together async or live, either roleplaying with each other or comparing how each person would phrase it, with AI or a fluent peer giving feedback. Builds coordination and synchronous/async social learning without needing a dedicated tutor present.

4. Team glossary built from real meetings/messages

With consent, the app surfaces work-specific jargon or phrases team members actually use (from meetings, Slack, emails) that a learner struggled with, turns them into bite-sized practice, and lets teammates annotate meaning/usage. Highly social because the content is

literally generated by the team's own communication — strong on awareness (seeing what phrases are trending in your team) and activity traces.

5. Location-triggered practice challenges between coworkers

Two coworkers who sit near each other or share a commute route get a lightweight daily prompt to practice a phrase together face-to-face (e.g. "next time you're both at the coffee machine, try this exchange"), with a quick post-practice check-in each rates the other's clarity. Strongly mobile (co-located, transient, location-triggered) and social (interaction + presence + peer feedback).
